2027학년도 경찰대학 1차 시험

- 영어 -

응시자 유의사항
※ 시험이 시작되기 전까지 표지를 넘기지 마십시오.

경 찰 대 학

http://www.police.ac.kr

※ 총 13쪽 45문항(2점 35문항, 3점 10문항)입니다. 각 문항의 답을 하나만 고르시오.

[1-5] 밑줄 친 단어의 뜻으로 가장 적절한 것을 고르시오.

1. According to the news flash, heavy snow has closed the mountain passes and <u>isolated</u> locals.

① pleased ② separated ③ surprised
④ injured ⑤ spared

2. Astronauts might not be happy spending a week inside a <u>compact</u> space capsule waiting for the next landing opportunity.

① unstable ② hazardous ③ breakable
④ temporary ⑤ tight

3. Trust is a vital <u>ingredient</u> in any successful relationship, acting as the foundation upon which mutual respect and understanding are built.

① element ② obstacle ③ consequence
④ illusion ⑤ disturbance

4. It is now widely recognized that the social and political struggles over citizenship have <u>acquired</u> a new intensity.

① overcome ② lost ③ avoided
④ gained ⑤ ignored

5. For the first time in human history more people now <u>reside</u> in cities than outside of them.

① dwell ② travel ③ gather
④ survive ⑤ compete

[6-7] 다음 대화의 빈칸에 들어갈 말로 가장 적절한 것을 고르시오.

6.

A: Hey, Ji-hoon. I heard you're planning to apply for the student exchange program in Canada next semester.
B: Yeah, I really want to go, but I'm hesitant because my English isn't perfect yet. I'm worried I won't fit in.
A: Don't let that hold you back! It's a great opportunity to improve your language skills and experience a new culture.
B: I know, but what if I fail the interview or struggle with the classes there?
A: You'll never know unless you try. If you don't submit the application now, you'll definitely regret it later.
B: _____
A: Exactly. Just give it your best shot and see what happens.

① You're right. Better safe than sorry.
② Don't worry. I'm completely confident that I'll pass it.
③ Honestly, I think I'd rather just stay home and study.
④ I guess you're right. Nothing ventured, nothing gained.
⑤ Well, I've already missed the application deadline anyway.

7.

A: Min-su, look at your schedule for this week! You've packed every single hour with lectures, tutoring, and soccer practice.
B: I have to, Charlie. The final exams are coming up, and I also need to stay in shape for the upcoming tournament.
A: I understand you want to excel in everything, but you're pushing yourself too hard. You barely slept four hours last night.
B: I can handle it. I just feel like if I stop moving or take a break, I'll fall behind the other students.
A: Trust me, overworking like this will only ruin your health and focus. Remember, _____. If you break down, you won't be able to achieve any of your goals.
B: Hmm, maybe you have a point. I should probably adjust my schedule and get some rest tonight. [3점]

① a watched pot never boils
② birds of a feather flock together
③ a bow long bent at last waxes weak
④ don't count your chickens before they hatch
⑤ a loaf of bread is better than the song of many birds

[8-9] 밑줄 친 부분 중, 어법상 <u>틀린</u> 것을 고르시오.

8.

By the closing decades of the nineteenth century, it had become increasingly difficult to pin down what 'German socialism' stood for. On the one hand, there were the revolutionary ideas of Karl Marx and Friedrich Engels that ① <u>were</u> attracting an international following. Despite the fact that they had developed the majority of ② <u>their</u> ideas in exile, their 'Marxism' was still widely perceived as a distinctly German contribution to radical thought. On the other hand, there was the more ③ <u>domestic</u> German tradition of social democracy. Under the leadership of Ferdinand Lassalle, a political working-class movement developed in Germany in the 1860s. It was founded on the belief that socialist goals could be ④ <u>achieved</u> in co-operation with the state — a strategy that Marx decisively rejected. Finally, the history of German socialism ⑤ <u>reaching</u> a new and important chapter with Otto von Bismarck's social insurance laws of the 1880s, which made the German Empire the first European nation to feature such comprehensive social legislation.

* exile: 망명

9.

Although writing did not replace oral tradition, it did dramatically extend the reach of communications, and ① allow groups to write down and spread their histories, ideas, lore and laws. The invention and refinement of writing ② changed the relationship between memory and record, as well as people's sense of the reachable world. Complex societies existed before and apart from the development of writing, but writing made societies easier ③ to administer over distance. For better or worse, it allowed the development of bureaucracy. The esteemed political scientist Benedict Anderson saw it as fundamental to how communities understood ④ themselves in place and time. He argued that the emergence of print media in the modern era — writing circulated fast and far — produced a simultaneity of experience ⑤ what allowed people to see themselves as part of a connected community even when they could not encounter everyone in it. [3점]

* bureaucracy: 관료제

[10-11] 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것을 고르시오.

10.

As the US and Israel attacked Iran, there were plenty of terrible warnings that the oil price would go to $150 a barrel, or perhaps even $200. Flights would have to be ① cancelled as we ran short of jet fuel; petrol would have to be rationed. The closure of shipping lanes would send chemical and fertiliser prices soaring, ② triggering food shortages and factory closures. The global economy would be plunged into recession. Central banks started to consider an emergency response. In the event, none of that ③ happened. The price of oil did go up sharply, rising from $60 a barrel to close to $120 shortly after the conflict started. But rather than spiralling out of control, it ④ steadied and then started to fall again, dropping below $80 as Iran and the US agreed a 60-day ceasefire. There were ⑤ clear signs of food shortages, or any basic commodities running low, and there were still plenty of cheap flights available.

* ration: 배급하다

11.

In modern society, we are surrounded by an unprecedented abundance of choices, from the products we buy to the career paths we pursue. Common sense suggests that more options will lead to greater freedom and happiness, as individuals can find the exact match for their preferences. However, psychologists have found that an ① excess of alternatives can actually have a paralyzing effect on consumers. When faced with too many possibilities, people often experience choice anxiety, making it difficult to come to a decision at all. Furthermore, even after making a choice, individuals are more likely to feel ② dissatisfied with their outcome. This occurs because they tend to obsess over the ③ attractive features of the options they rejected, leading to regret and a sense of missed opportunity. Consequently, unlimited freedom of choice often ④ diminishes our psychological well-being. This suggests that maintaining a narrower range of options might sometimes be more ⑤ burdensome for decision-makers. [3점]

[12-14] (A), (B), (C)의 각 네모 안에서 문맥에 맞는 낱말로 가장 적절한 것을 고르시오.

12.

Like tangled claws grasping the soil, a mangrove's soil network takes up vast areas above the waterline of a coast, estuary or river. These root clusters not only (A) [benefit / damage] the plant, but the land that lies behind them. During stormy weather, when the coastline would usually get battered by waves, mangroves serve as a shield, slowing down waves that crash into them. The roots can also trap sediment moved by waves, preventing it from reaching shorelines and contributing to coastal erosion. Mangroves protect the land from brushing away, as well as stopping storm surges from flooding communities. Storm surges are (B) [abnormal / ordinary] rises in sea levels during a hurricane or storm, pushing water towards the shore. Beneath the surface, mangrove roots that grow into waterlogged soil help hold the soil together. This (C) [accelerates / reduces] the rate of erosion, as the water is less able to displace soil.

* sediment: 침전물 ** erosion: 침식

	(A)		(B)		(C)
①	benefit	……	abnormal	……	accelerates
②	benefit	……	abnormal	……	reduces
③	benefit	……	ordinary	……	accelerates
④	damage	……	abnormal	……	accelerates
⑤	damage	……	ordinary	……	reduces

13.

Space exploration is a polluting industry in various ways and in all its phases. As it is typical for all industrial production, the production of space technology and the transport of its products on Earth are far from being environmentally friendly activities. Also, the launching stage is a polluter: it produces noise pollution, dust and emissions. A recent example of the (A) [adverse / profitable] effects of launch activities is provided by a study which claims that launches at Russia's space base in Baikonur, Kazakhstan, cause serious health problems among people living below the rockets' flight path. For instance, the levels of endocrine disease and blood disorders in children are reported to be over twice the regional average. This is due to highly toxic propellants (notably hydrazine) which are (B) [dumped / purified] onto the land located along the flight trajectories: by a rough estimation, dozens of liters of unburned fuel is sprayed over several square kilometers of land with every launch. Local environmental groups have campaigned against the (C) [polluting / protecting] launches, but with little success.

* trajectory: 궤도

	(A)		(B)		(C)
①	adverse	·····	dumped	·····	polluting
②	adverse	·····	purified	·····	protecting
③	adverse	·····	dumped	·····	protecting
④	profitable	·····	purified	·····	polluting
⑤	profitable	·····	dumped	·····	polluting

14.

When America's "first spaceport" rose out of the bush along Florida's Atlantic coast at the beginning of the 1960s, it seemed to many observers that a long-lived and stubborn wilderness had finally been conquered by technology. NASA's Kennedy Space Center (KSC), as it is now known, was to be the centerpiece of a vast spaceflight program that would reshape American culture and foreign policy into an image of total technological (A) [degradation / dominance]. Boldly carved into the "wasteland" of Cape Canaveral, set astride ancient Indian burial mounds and delicate coastal ecologies, the spaceport would propel humanity to (B) [familiar / unknown] cosmic shores, just as Europeans had landed on the same white beaches that now housed rocket gantries. It seemed as improbable as it was satisfying — the sight of white painted rockets rising above what had been just a few years earlier nothing but a mosquito-infested swamp. It was a symbol of (C) [progress / regress], of colonial uplift of the most romantic kind, and a bold vision for the future. [3점]

* astride: 양쪽으로 나뉘는 ** gantry: 받침대 *** swamp: 습지

	(A)		(B)		(C)
①	degradation	·····	familiar	·····	progress
②	degradation	·····	unknown	·····	regress
③	dominance	·····	unknown	·····	progress
④	dominance	·····	familiar	·····	regress
⑤	dominance	·····	unknown	·····	regress

15. Vera Rubin에 관한 다음 글의 내용과 일치하는 것은?

Vera Rubin was born in 1928 in Philadelphia and grew up in Washington, DC. She always had an interest in the night sky, looking up at the stars with her cardboard telescope when she was a child. At the time she was ready to earn her master's degree, Princeton University would not admit women to their graduate astronomy program, so Vera went to Cornell University instead. At the age of 22 she made headlines and shocked scientists with her theory that the universe was rotating. Scientists today are still debating this question, though most evidence points to Vera being correct. After earning a PhD from Georgetown University, Vera started work at Carnegie Institution of Washington, where she met Kent Ford. He invented a new spectrometer that could be used to see light from distant stars like never before and measure the Doppler effect of stars in galaxies. Vera used his spectrometer to start her work on spiral rotating galaxies.

* spectrometer: 분광계

① She grew up in Philadelphia.
② She earned her master's degree from Princeton University.
③ She proposed the theory of a rotating universe.
④ She received her PhD from Cornell University.
⑤ She invented a new spectrometer herself.

16. 다음 글의 내용과 일치하는 것은?

Earlier this year the Federal Reserve Bank of New York published figures showing that American philosophy graduates are more likely to have jobs than their peers who studied computer science. In 2024, the most recent year for which numbers are available, 7% of those who had studied computer science were unemployed, against just 5.1% of philosophers. Many are being snapped up by AI firms themselves. Students get job offers before they have graduated, says Luciano Floridi, a philosopher at Yale University. Academics are moving, too. Dr. Floridi describes the scale of departures from philosophy departments as a "haemorrhaging." Some of the lessons that philosophy can offer AI researchers are ancient. The Socratic method — as described by Plato, an ancient Greek philosopher — uses pretended ignorance and sequential questioning to clarify meanings, spot contradictions and reveal ramifications. Many current AI systems tend towards sycophancy. Models trained in the Socratic method, says Jörg Noller, an expert on philosophy and AI at Ludwig Maximilian University of Munich, are less keen on people-pleasing and more willing to pursue the truth.

* ramification: 파급 효과 ** sycophancy: 아첨

① Computer science graduates in the US have recently shown lower unemployment rates than philosophy graduates.
② AI companies are showing declining demand for philosophy graduates.
③ Most philosophy academics have shown little interest in working with AI companies.
④ Current AI systems cannot generate responses that please users.
⑤ AI models trained by the Socratic method tend to provide users with accurate replies.

17. 다음 글의 내용과 일치하지 <u>않는</u> 것은?

The Braille system, invented in 1824 by a French teenager named Louis Braille, fundamentally transformed literacy for the visually impaired. Louis, who lost his sight due to a childhood accident, became dissatisfied with the slow and bulky reading methods available at his school. He found inspiration in "night writing," a tactile military code created by Captain Charles Barbier for soldiers to communicate silently in the dark. Barbier's system used a grid of twelve raised dots, which Louis found too complex to read quickly with a single fingertip. Consequently, he modified the military code, reducing the structure into a more efficient six-dot cell organized in a three-by-two grid. This elegant adjustment allowed users to recognize an entire character instantly without moving their fingers. Despite initial resistance from educators who preferred traditional raised letters, the Braille system eventually achieved global recognition, opening up a world of independent learning and communication for millions.

* tactile: 촉각의

① Louis Braille은 어린 시절 사고로 시력을 잃었다.
② 군인들이 어둠 속에서 소통하기 위해 고안된 군사 암호가 존재했다.
③ Louis Braille은 Barbier의 시스템이 복잡하다고 생각했다.
④ Louis Braille은 기존의 12개 점 구조를 6개 점 구조로 축소했다.
⑤ 교육자들은 처음부터 Braille 시스템을 열렬히 환영했다.

18. 다음 글의 제목으로 가장 적절한 것은?

During the 1920s and 1930s, movie making proliferated far beyond Hollywood's production studios and movie theaters as amateurs took up 16mm and 8mm equipment to make their own movies. In 1926, shortly after the introduction of 16mm film in 1923, a group of ambitious amateurs banded together to form the Amateur Cinema League (ACL). This group was the idea of Hiram Percy Maxim, an inventor and eager radio and film amateur. At the heart of this effort was a set of utopian ideals that saw amateur cinema as a new art form and a new mode of communication that could connect people around the world, providing them with opportunities for self-expression not permitted by the commercial film industry. Over the course of the next decade, Hiram Percy Maxim led the ACL's investigation of the amateur medium's possibilities by articulating — in both his writing and film practice — the issues of film technique, form, and presentation that would set amateur film apart from commercial cinema, on the one hand, and mere home movies, on the other.

* proliferate: 확산하다 ** articulate: 분명히 말하다

① The 1920s: The Golden Age of Commercial Studios
② Amateur Cinema: A New Art Form Beyond Hollywood
③ The Impact of Film Technique on Hollywood's Success
④ Why Amateur Cinema Remained as Mere Home Movies
⑤ Maxim's Utopian Ideals for the Commercial Film Industry

[19-20] 다음 글의 주제로 가장 적절한 것을 고르시오.

19.

In the field of behavioral economics, "choice architecture" refers to the way options are presented to consumers, which subtly but significantly influences their decisions. One of the most powerful tools in this framework is the default option — the pre-set choice that takes effect if a person does nothing. Research shows that humans possess a strong cognitive bias toward the status quo because changing a pre-set selection requires active mental or physical effort. For instance, when companies automatically enroll new employees in retirement savings plans while allowing them to opt out, participation rates skyrocket compared to systems that require manual registration. By strategically organizing the choice environment, architects can guide individuals toward beneficial behaviors without restricting their freedom of choice. Thus, the deliberate structuring of defaults serves as an invisible but highly effective mechanism for shaping public and private choices.

* status quo: 현재 상태

① the psychological loss of limiting consumer options
② the historical development of modern behavioral economics
③ the role of default options in shaping human decision-making
④ the economic benefits of maximizing financial freedom for workers
⑤ the conflict between personal preferences and corporate structures

20.

Despite struggling with air pollution, access to clean water, waste disposal and resource management, we continue to celebrate sky-scraping artificial giants as the symbols of our architectural achievements. But what if the best materials at our disposal aren't necessarily synthetic? Everything we need to create smarter, healthier urban environments is already around us in nature. Combining properties of living organisms with our ingenuity could blur the distinctions between the natural and the artificial, changing our lives for the better. Dr. Rachel Armstrong, a professor of experimental architecture at Newcastle University, studies how living systems and synthetic biology could help produce new forms of architecture. She is part of a wave of proponents of 'living architecture' who believe that by blocking out nature, we are choking ourselves. These path makers want to find ways to tear down the walls we've built around ourselves and replace them with 'living walls' covered in soil and vegetation. [3점]

* synthetic: 합성의 ** blur: 희미하게 하다

① stability of natural building materials
② traditional methods of urban planning
③ the environmental effects of skyscrapers
④ integrating nature into modern architecture
⑤ artificial materials used in modern architecture

[21-22] 다음 글의 요지로 가장 적절한 것을 고르시오.

21.

The transition from print to digital media has fundamentally altered not just how we read, but how deeply we process information. When reading physical books, the fixed layout and tactile experience of turning pages provide spatial anchors that help the brain construct a coherent mental map of the text. This sustained focus allows for deep reading processes, such as critical analysis, analogical thinking, and empathetic reflection. In contrast, the digital environment is designed for rapid skimming, multitasking, and navigating hyperlinks. While this horizontal scrolling efficiency enables us to scan vast amounts of data quickly, it trains the brain to prioritize speed over substance. Consequently, cognitive psychologists warn that excessive reliance on digital screens overtaxes our working memory and diminishes our capacity for long-form comprehension, gradually eroding our ability to engage with complex, nuanced arguments.

① Hyperlinks within digital texts play a crucial role in enhancing empathy.
② Digital tools should be actively utilized to maximize critical reading skills.
③ Print media is more effective than digital tools in scanning massive datasets.
④ Excessive reading on digital screens undermines deep comprehension and cognitive depth.
⑤ Technological advancements in reading media have expanded human cognitive capacity.

22.

In the summer of 1948, Winston Churchill telephoned his publishers, hopping with rage. He had just received a finished copy of *The Gathering Storm*, the first volume of his epic history of the Second World War. When he opened it, however, he was horrified to find the French Army described as the "poop of the life of France." Obviously, he had meant to say "prop" — but somehow, a mistake had snuck in. Too late: the best his publishers could do was to include an errata slip and promise to do better in future. Churchill's experience was far from unusual. Since human beings first started writing things down they have been getting them wrong. Monks labouring in medieval scriptoria introduced all kinds of errors into the texts they were copying. They even invented a demon called Titivillus to blame this on. And when printing came along, things only got worse. Typos abounded, words got left out, and sometimes whole pages got mixed up.

* errata: 정오표

① Mistakes in writing have continued from handwritten texts to printed books.
② Modern printed books are more reliable than ancient manuscripts.
③ Medieval monks created myths to explain mistakes in manuscripts.
④ Famous authors are more likely to make mistakes than ordinary writers.
⑤ Modern publishing methods have eliminated most writing errors.

[23-28] 다음 글의 빈칸에 들어갈 말로 가장 적절한 것을 고르시오.

23.

Students' access to AI for support isn't the issue, since teachers have always scaffolded learning. The problem lies with _____. In a Year 9 history lesson, for example, a teacher might ask students to interpret a source and build an argument. Traditionally, this would involve some degree of uncertainty, trial and error, and discussion. With AI, a student can bypass that whole process and produce a polished response that appears secure, but which isn't rooted in their own understanding. The behavior being reinforced here is subtle, yet significant. Why persist, when the answer is immediately available? Why wrestle with difficulty, when clarity can be generated on demand? There is a more positive pathway here, though. When guided carefully, AI can be used to model approaches, generate alternative perspectives or support revision. The difference lies in whether the student is thinking first and using AI to refine, or outsourcing all their thinking together.

* scaffold: 발판을 만들다

① the unequal access to digital resources
② the removal of productive struggle
③ the lack of teacher guidance
④ the overuse of digital technology
⑤ the expectation of immediate correctness

24.

Social media and video platforms have, for the first time, overtaken news organizations' websites and apps as the most widely used way to access online news, reaching 54 percent of respondents globally compared with 51 percent for news sites' own platforms, per the Reuters Institute's 2026 Digital News Report. It is a milestone that captures what researchers call the "platformization" of news consumption, as audiences increasingly discover information through feeds, creators and algorithms rather than front pages. Yet, at the same time, _____. Just 37 percent of people say they trust most news most of the time — the lowest level recorded since 2015. In the United States, that figure drops to roughly one in four. And concern about misinformation is rising, with 62 percent of respondents worried about what is real or fake online. Correlation is not causation — but the overlap is hard to ignore. Platforms offer reach and immediacy, but also blur lines between reporting, opinion and outright fabrication.

* milestone: 이정표

① trust is sliding
② audiences are decreasing
③ news sources are ignored
④ platforms get commercialized
⑤ emotional reactions are important

25.

In the philosophy of science, a paradigm consists of a dominant set of theories, methods, and assumptions that define a scientific discipline during a specific era. During periods of what Thomas Kuhn called "normal science," researchers rarely question these foundational beliefs. Instead, they focus their efforts on solving small puzzles within the established boundaries of the existing framework. When anomalies — results that directly contradict the paradigm — inevitably arise, they are initially dismissed as experimental errors or minor exceptions rather than flaws in the theory itself. This conservative nature of the scientific community ensures stability, but it also creates a strong resistance to intellectual innovation. Consequently, a completely new explanatory model is almost never welcomed immediately; rather, the scientific establishment naturally works to _____.

① ignore qualitative data
② embrace radical changes
③ promote creative thinking
④ accelerate linear progress
⑤ protect existing frameworks

26.

In environmental ethics, the "shifting baseline syndrome" describes a gradual change in the accepted norms for what a healthy natural environment should look like. Each generation of scientists or citizens accepts the state of the ecosystem they encountered in their youth as the natural baseline. When ecological degradation occurs over time, the next generation perceives this already damaged environment as the normal, healthy starting point. Consequently, what one generation considers a severe loss of biodiversity, the next generation might view as a stable and original condition. This psychological shift hides the long-term, cumulative destruction of the natural world, as people fail to notice the ongoing decline. Therefore, without a long-term historical perspective, efforts to restore degraded ecosystems are bound to fail because we end up _____.

① relying solely on quantitative figures
② accepting a degraded state as normal
③ protecting only popular endangered species
④ prioritizing short-term local economic profits
⑤ overestimating natural restoration of habitats

27.

When a work of art is created, it is influenced by the cultural moment of its birth. In other mediums like film and television, works are immutably recorded, unable to be easily altered. When revisited decades later, many works no longer meet the cultural moment and become museum pieces of the time in which they were created. The cultural norms and expectations of one decade are not the same as the cultural norms and expectations of the next decade, often presenting older works outdated or even offensive. The same is true of live theatre except that the only part of the work that is recorded and fully reproduced is the text. Each new production has the opportunity to take the text and through the process of restaging it, create a new work of art. It is no wonder then that many productions of older works end up starting conversations (or even arguments) about _____. [3점]

① the appropriateness of that particular text in a new cultural moment
② the technical challenges of permanently recording a live performance
③ the superiority of live theatre in preserving the history of the past
④ the financial success of restaging older theatrical works
⑤ the original meaning of the text intended by its author

28.

According to the philosophy of phenomenology, our perception of the world is not a passive recording of objective facts, but an active, conscious interpretation. We do not merely see a physical object as it exists in isolation; rather, we experience it through the lens of our prior expectations, cultural backgrounds, and immediate emotional states. This implies that two individuals observing the exact same event can derive fundamentally different meanings from it. For instance, an old, weathered building might represent a historic treasure to an architect, while a real estate developer might view it as nothing more than a site ready for destruction. The object itself remains unchanged, yet the perceived reality _____. Therefore, any attempt to understand human experience by focusing solely on external, measurable data is fundamentally incomplete, because meaning is actively constructed by the observer rather than found in the environment. [3점]

① is permanently stored in our long-term memory
② is determined by the physical durability of the object
③ gets distorted by the complete lack of historical facts
④ shifts entirely based on the perspective of the observer
⑤ remains identical for everyone within the same community

[29-30] 다음 글에서 전체 흐름과 관계 <u>없는</u> 문장을 고르시오.

29.

Just like a human brain consolidates memories through repeated neural activity to strengthen its ability for information recall, intelligent computer systems become smarter through repeated exposure to data. ① A computer uses data from human input to match shapes and movements with what humans perceive them to be. ② Over time, as a variety of images are experienced and human input corrects any mistakes the camera system makes, the CCTV becomes more reliable. ③ However, the widespread use of these advanced surveillance technologies has sparked intense public debates regarding the invasion of personal privacy. ④ For example, the data input into the system may only describe general movements, such as walking, running and cycling, and it's up to the computer to best match the movements of the people in the footage with the closest explanation in the algorithm. ⑤ As an infinite variety of shapes and movement types are revealed, the computer builds its data and is more likely to make accurate analyses of movement over time.

30.

In evolutionary biology, animal communication signals are understood to have evolved to maximize the sender's survival and reproductive success. ① To ensure these signals are effective, they must be easily distinguished from background noise and accurately interpreted by the intended recipient. ② For instance, many bird species utilize high-pitched, sharp calls in dense forests because these specific sounds can cut through the thick foliage without losing clarity. ③ This adaptation allows them to maintain social contact or warn others of predators effectively over long distances. ④ Some endangered bird species, however, are facing severe habitat loss due to rapid urbanization and climate change. ⑤ Therefore, the physical structure of a communication signal is intricately linked to the specific environmental constraints of the habitat in which the animal lives.

* foliage: 잎

[31-34] 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳을 고르시오.

31.

This aura cannot be captured by a photograph, a poster, or any other form of technological reproduction.

For centuries, experiencing a work of art required traveling to its physical location, whether it was a remote cave painting or a painting in a cathedral. (①) In his influential essays, cultural critic Walter Benjamin called this distinct authority and magical atmosphere of the original artwork its aura. (②) Instead, the physical presence of the original work at a specific location is what creates its unique emotional power. (③) When an artwork is mechanically copied and widely distributed, it is completely removed from the domain of its traditional heritage. (④) Consequently, while modern mass production democratizes art by making it accessible to anyone anywhere, it inevitably depreciates the aura of the original. (⑤) As a result, the deep, almost spiritual connection that viewers once felt in the presence of a true masterpiece is replaced by a more casual, everyday consumption.

32.

Despite the challenges, caregiving can be wonderfully rewarding.

For many who take on the role of caregiver, the responsibility lands suddenly, perhaps when a parent or spouse has a serious stroke, an incapacitating fall, or a diagnosis of advanced cancer. (①) For others, the realization that help is needed may creep up gradually as your loved one struggles to keep up with household maintenance, manage health care or finances, or even handle daily tasks such as dressing and making meals. (②) The spectrum of tasks caregivers undertake is truly vast. (③) Some responsibilities, such as grocery shopping, housekeeping, doing laundry, and cooking, are familiar to us all. (④) Giving injections, changing bandages, or helping a disabled partner get from the bed to the bathroom can be far more challenging. (⑤) A review of 41 studies found that caregivers report gaining stronger family relationships as well as a sense of personal accomplishment, growth, and purpose.

33.

Amidst this landscape, agriculture stands as a base of the continent's economy, employing between 40–60% of the workforce in many countries.

In Sub-Saharan Africa, a silent barrier to economic inclusion and social mobility persists: one in four adults lacks identification, according to a World Bank report. (①) This absence of identity is not only an obstacle to obtaining vital services, healthcare, and government programs, but also excludes a significant portion of the population from the formal economy. (②) This challenge is compounded by a digital divide, with nearly 60% of the region's adult population reportedly without internet access, further isolating rural communities. (③) Yet, despite the sector's central role, farmers and other agricultural entrepreneurs across Africa continue to struggle with poverty. (④) Smallholder farmers face several challenges that make it hard to earn a living wage. (⑤) For example, local agricultural markets may be small, constraining a farmer's ability to buy quality inputs, like seeds and fertilizers, or sell produce at a fair price.

34.

Because the targeted behaviors were observable and could be directly assessed, behaviorists were able to empirically measure change as a result of their interventions.

Acceptance and commitment therapy is a behavioral therapy that is part of a tradition referred to as the third wave of behavioral interventions. Initial behavioral interventions were based on operant and classical conditioning theories. (①) These initial interventions were innovative in that they were aimed at direct and observable behavioral changes, such as treating a fear response by exposing the client to feared objects and situations until the fear response was extinguished. (②) Behavior therapy was at the forefront of the movement for evidence-based treatments. (③) This interest in theory and measurement has been described as the first wave of behavior therapy. (④) The second wave of behavior therapy included addressing internal experiences such as thoughts and feelings, which had been largely unaddressed in earlier models. (⑤) These therapies include cognitive behavioral therapy interventions, where the aim is to change observable behaviors by first restructuring maladaptive thoughts. [3점]

* empirically: 실증적으로

35.

In the early 19th century, portrait painting was a luxury reserved exclusively for the wealthy, as it required immense time and money. Ordinary families had no way to preserve the visual likeness of their loved ones for future generations.

(A) And yet, these early photographs had a significant drawback: they were fragile, expensive, and could not be replicated. Each image was a one-of-a-kind piece on a metal plate, meaning the technology still remained out of reach for the working class.

(B) In 1839, however, a dynamic shift occurred with the invention of the daguerreotype, the first publicly available photographic process. Suddenly, a mechanical device could capture a highly detailed image of a person in a matter of minutes.

(C) The true democratization of portraiture arrived later with the introduction of paper-based negatives. This breakthrough allowed multiple paper prints to be made from a single exposure, drastically reducing costs and allowing ordinary people to finally afford family portraits.

For decades, linguists and psychologists have debated the extent to which the language we speak shapes the way we think. This concept, known as linguistic relativity, suggests that different linguistic structures can induce distinct ways of categorizing and perceiving the world.

(A) For instance, in a famous experiment, speakers of languages that assign genders to inanimate objects described those objects differently. A key, which is masculine in German but feminine in Spanish, was described as “hard” and “heavy” by Germans, but “lovely” and “intricate” by Spaniards.

(B) However, critics of strict linguistic relativity argue that human thought is fundamentally universal, going beyond the boundaries of vocabulary and grammar. They maintain that while language may influence what we pay attention to, it does not permanently limit our cognitive capacity.

(C) This striking difference demonstrates how grammatical categories can subtly direct our focus toward specific features of an object. The language people use serves as a cognitive habitual filter, bending their subjective experience of reality. [3점]

Social ties may have a small impact on prejudice over time, according to a longitudinal social network analysis of data from 2,484 adolescents in Germany. The findings, published in *American Psychologist*, indicate that the degree and direction of change depended on the level of prejudice the teens and their friends had at the beginning of the study. Using data from students in 10 German schools, researchers modeled the students' friendship networks, simulating the influence of friendship ties on students' attitudes toward people from ethnic and religious outgroups over 9 months. The results indicated that friends who started with similar levels of prejudice tended to show minimal attitude change over time; friends who began the study with opposing attitudes had the largest effect on each other, showing slight shifts toward each other over time. At most, students' social ties were linked with a 3% change in prejudice, suggesting a small but noticeable effect.

* longitudinal: 장기적인

⬇

Friendship networks can shape adolescents' prejudice, but their influence is ____(A)____, becoming most evident when friends initially have ____(B)____ attitudes.

	(A)		(B)
①	considerable	……	similar
②	harmful	……	different
③	harmful	……	neutral
④	limited	……	different
⑤	limited	……	similar

38.

The explosion in the world's population appears to be slowing down. Fifty years ago, an average woman had between five and six children. The global average now is just 2.6. In a mere two generations, therefore, the reproduction rate has sunk to slightly above the replacement level, which is currently 2.3. In half the world, people are having fewer children than needed to maintain the species. This includes countries like the United States, China, and Indonesia. In the European Union, Japan, and Russia, the population is shrinking for the first time in human history for reasons other than war, disease, or other calamities. It is a matter of free will, with women's education and rising prosperity helping produce a remarkable slowdown. Worldwide, the number of births is no longer increasing. The human race is incredibly flexible when it comes to procreation.

* procreation: 출산

⬇

While the world's population experienced explosive growth in the past, the global reproduction rate is now ____(A)____, mainly due to individuals' ____(B)____ choices driven by improved education and prosperity rather than disasters.

	(A)		(B)
①	stabilizing	……	restricted
②	declining	……	restricted
③	declining	……	voluntary
④	expanding	……	voluntary
⑤	expanding	……	enforced

Ramesses III presented himself as a traditional warrior-pharaoh, defending Egypt against repeated Libyan attacks and threats from other foreign enemies. Reliefs and inscriptions depict decisive victories, but modern historians view his reign as a kind of crisis management, with Egyptian prosperity declining. Not only was the kingdom involved in expensive wars, but agricultural output was falling. Despite these (a) pressures, the Egyptian pharaoh was viewed as a divine intermediary, responsible for maintaining *maat* — harmony between gods, people and nature. Feeding workers, paying temple staff and undertaking major construction projects were all part of that sacred duty. Before Egypt had a system of coinage, it used a redistributive economy, with workers paid in barley and wheat. The state collected agricultural produce as tax, stored it in granaries, and redistributed it to soldiers, officials, priests and specialised workers. The system was (b) effective while harvests were stable and administration functioned efficiently. However, during periods of disruption, the impacts of shortages spread through society. A strike (c) unfolded at the settlement now known as Deir el-Medina, home to the skilled artisans who carved and painted the royal tombs in the Valley of the Kings. These workers were salaried state employees, free from agricultural work, housed by the government and supplied directly from royal granaries. Many were (d) illiterate, leaving behind letters, complaints and administrative records that provide a rare view into the lives of non-elite Egyptians. When Ramesses III's administration fell far behind on promised rations, families at Deir el-Medina faced (e) serious consequences.

* granary: 곡물 창고

When Alöys Senefelder invented lithography in Bavaria in 1796, he intended it primarily for commercial usage, but artists soon discovered the (a) advantages of this new medium. It allowed them to draw directly on the stone plate, replacing the (b) laborious process of creating a drawing on a metal plate by carving lines, as in engraving, or using repeated acid baths, as in etching. Lithography produced images that seemed miraculous in speed and precision, equally able to create line or shadow. In England, *Specimens of Polyautography* (the term first employed for the lithographic process) was published in 1803 with lithographic drawings by several artists, including Henry Fuseli. By 1819, Senefelder had commissioned a series of lithographic drawings to accompany his *Art of Lithography*; *The Genius of Drawing Encouraging the Art of Lithography* by Nicolas-Henri Jacob effectively serves as its frontispiece. Many contemporaneous critics felt that this sentiment should be (c) reversed, that it was, in fact, the genius of lithography that encouraged the art of drawing. Most early lithographs exhibited at the Salon were portraits, views of landscape or cityscape, or reproductions of esteemed works of art; there was little genre imagery and no caricature at all although these categories were rapidly becoming (d) predominant in lithographic production. Lithography transformed drawing from a private into a public art, ensuring, as one critic wrote, that drawing would be "no longer shut away in portfolios but given to the public." During these early decades, lithography did just that, finding the (e) smallest audience of any contemporaneous art form and initiating what has been termed "the nineteenth-century media explosion."

(A)

One sunny Saturday afternoon, Ethan and his father, David, decided to hike up Mount Greenwood, a steep but beautiful mountain near their home. Ethan was excited to spend quality time with his father, enjoying the fresh air and the lively green scenery. David, an experienced hiker, led the way with a bright smile, reassuring (a) his son whenever the path became a bit rocky. As they neared the summit, however, the sky suddenly turned gray, and a light rain began to fall, making the trail dangerously slippery.

(B)

Within an hour, Officer Brooks arrived at the scene, carrying a rescue backpack. He quickly assessed the situation and comforted the panicked teenager, promising that everything would be fine. Officer Brooks then turned (b) his attention to David, carefully wrapping the swollen ankle with a professional bandage. Thanks to the officer's comforting words, David managed to calm down, though he was still worried about how they would get down the mountain in the worsening weather.

(C)

Officer Brooks proved to be a true hero. He helped David stand up, allowing (c) the injured man to lean heavily on his strong shoulders. Together with Ethan supporting the other side, they began their slow, cautious descent. It was a tough trip, but the officer never complained, constantly checking on the father's condition. By the time they reached the base of the mountain, the ambulance was waiting. Tears of relief filled his eyes as Ethan thanked the officer, knowing that his father was finally safe and in good hands.

(D)

Disaster struck when David took a misstep on a wet, mossy rock. With a sharp cry of pain, (d) he tumbled down a small slope and clutched his right ankle. Ethan rushed to his side, his heart pounding with fear. David tried to stand, but the intense pain made it impossible for him to take even a single step. Realizing they were far from the main trail and that (e) his father was severely injured, Ethan knew he had to act quickly. The son immediately pulled out his phone and called the emergency services.
